Re: Interpretation of ANSI/CEA-774-B

It was a pleasure speaking with you and Chris Szymanski on the phone yesterday. Here is a written record of the interpretation that R5 Antennas Committee Chair Ray Conover provided in response to your question.

Regarding test a) in section 8.3 of ANSI/CEA-774-B, the signal levels listed assume an antenna with 0 dB gain. You are allowed to adjust these levels to match the actual gain of the antenna you will be using. This must be documented in your test results.

Thank you for your interest in CEA standards.
