NOTICE

Consumer Technology Association (CTA)TM Standards, Bulletins and other technical publications are designed to serve the public interest through eliminating misunderstandings between manufacturers and purchasers, facilitating interchangeability and improvement of products, and assisting the purchaser in selecting and obtaining with minimum delay the proper product for his particular need. Existence of such Standards, Bulletins and other technical publications shall not in any respect preclude any member or nonmember of the Consumer Technology Association from manufacturing or selling products not conforming to such Standards, Bulletins or other technical publications, nor shall the existence of such Standards, Bulletins and other technical publications preclude their voluntary use by those other than Consumer Technology Association members, whether the standard is to be used either domestically or internationally.

Standards, Bulletins and other technical publications are adopted by the Consumer Technology Association in accordance with the American National Standards Institute (ANSI) patent policy. By such action, the Consumer Technology Association does not assume any liability to any patent owner, nor does it assume any obligation whatever to parties adopting the Standard, Bulletin or other technical publication.

This document does not purport to address all safety problems associated with its use or all applicable regulatory requirements. It is the responsibility of the user of this document to establish appropriate safety and health practices and to determine the applicability of regulatory limitations before its use.

1 Introduction

Managing energy usage requires knowledge of how much and where energy is used, ideally down to the individual device level. This typically requires each device to have built-in energy measuring circuitry or an external device that can measure the energy it is using. Unfortunately there is little consumer interest in such features today and therefore little incentive for a manufacturer to add the cost of metering circuitry to their products.

A low cost alternative to adding energy measurement circuitry is for manufacturers to store, at the time of manufacture, an estimated value for the amount of energy the device uses in each operating mode, on/off/sleep/etc., and then log how long it is in each mode during operation. This state-based energy usage information (EUI), although only an estimate, can be provided in a standard form over a Local Area Network (LAN) on request from an energy management system or an application running on a smart phone, tablet or PC. Such applications could then, for example, build a history of that device's energy usage for use by the consumer or third party service providers. This approach is not limited to consumer products. It can easily be added to commercial and even industrial products with little to no cost to the end product.

This standard does not define any Demand-Response features. Standards such as ANSI/CEA 2045, ISO/IEC 15067-3, OpenADR 2.0, and others already address those features. CE-EUI does not preclude support for demand response (DR) functionality in the future as that market develops.

This standard provides an information model for other groups to develop implementations specific to their network, protocol and needs.

The energy usage information provided by devices implementing this standard can be used by "Green Button" applications to augment and disaggregate energy usage data provided by utilities.

2 Scope

This application layer standard provides an Information model that specifies the minimum requirements for consumer electronic and other networked devices to communicate Energy Usage Information (EUI) over a LAN.

3.1 Normative References

The following standards contain provisions that, through reference in this text, constitute normative provisions of this standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this standard are encouraged to investigate the possibility of applying the most recent editions of the standards listed here.

There are no normative references in this standard.
